Status and Plans

Current Status

- http://wwwhep.phys.uvic.ca/~uvatlas/hec_adc/hec_adc.html
- Version 3.4 is the latest release.
- Improvements since version 3.3
  - new digital filtering package
  - new maximum adc array treatment
  - updated manual

Future Plans

- have received first MC bank for testing. We will add a MC input stream to the code.
- analysis of the April 98 testbeam data has lead to imporvements to standard ntuple content. More to come....
- patch will be added to take into account 6ns tdc shift at pole-zero adjustment in April (only affects early runs)
- modify code structure to treat slow control records (and any other record types)
- online mode will be basically unchanged from April version
