

Global Fit for Branching Fractions and Form Factor Slope of $B \rightarrow D^{(*)}/\nu$ Decays

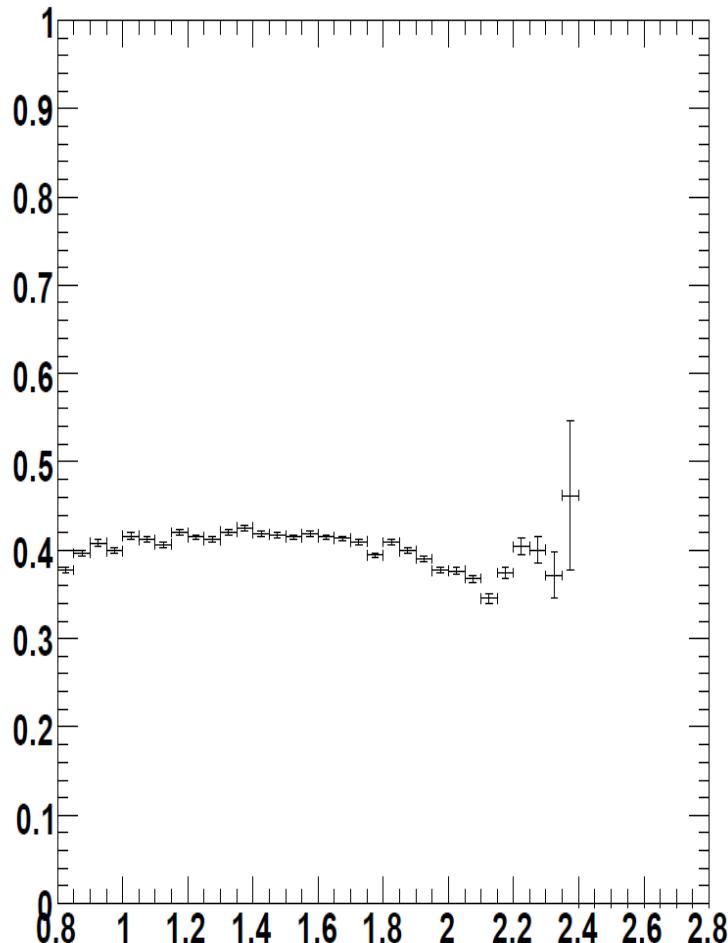

- Effect of $D\pi\pi/\nu$

Effect of $B \rightarrow D^{(*)} \pi \pi / \nu$ - method

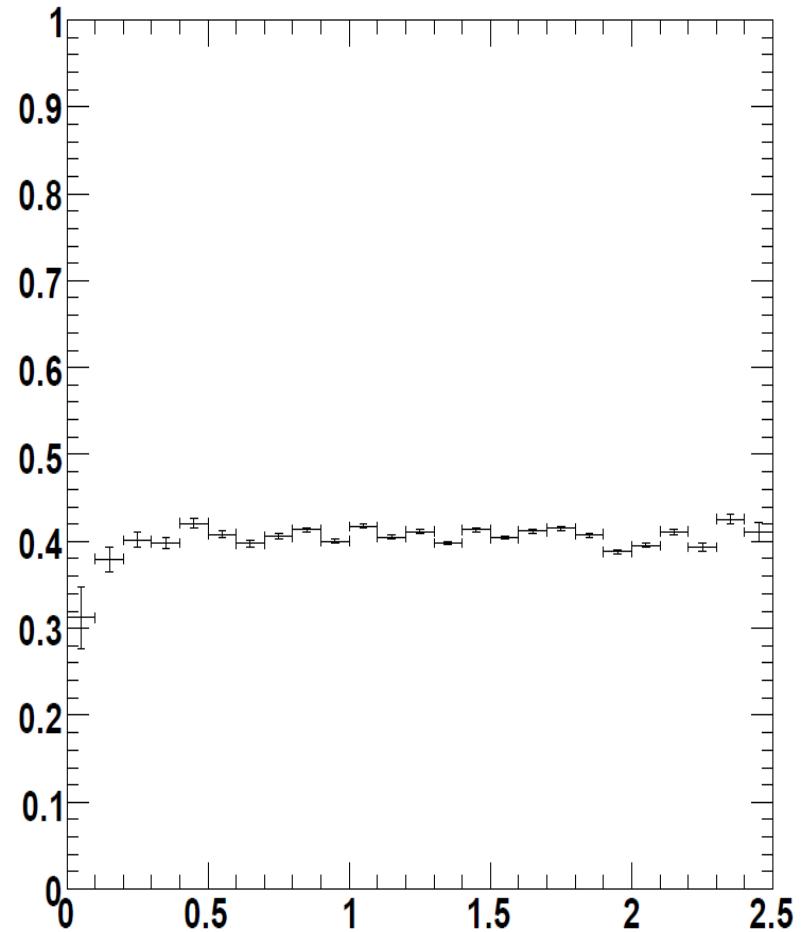

- We generate 4 different types of decays :
 - $B \rightarrow X \nu$, $B \rightarrow X^* \nu$, $B \rightarrow Y \nu$, $B \rightarrow Y^* \nu$
 - X and Y are pseudo-scalar and X^* and Y^* are vector particles.
This affects lepton spectrum.
 - X and X^*
 - Mass = 2.61 GeV (just above $D^* \pi \pi$ threshold)
 - Width = 300 MeV, Decays to $D^{(*)} \pi \pi$
 - Y and Y^*
 - Mass = 2.87 GeV (just above $D^* \rho$ threshold)
 - Width = 100 MeV, Decays to $D^{(*)} \rho (\pi \pi)$
 - 3-body decay (X, X^*) and 2-body decay (Y, Y^*) affects D momentum spectrum.
- The numbers shown are for sum of the 4 modes in the case where each mode has the same BF.
- We use 3D efficiency matrix to convert generated histograms to reconstructed one.
